Fig. 6 MCU I/O INTERFACE CIRCUIT

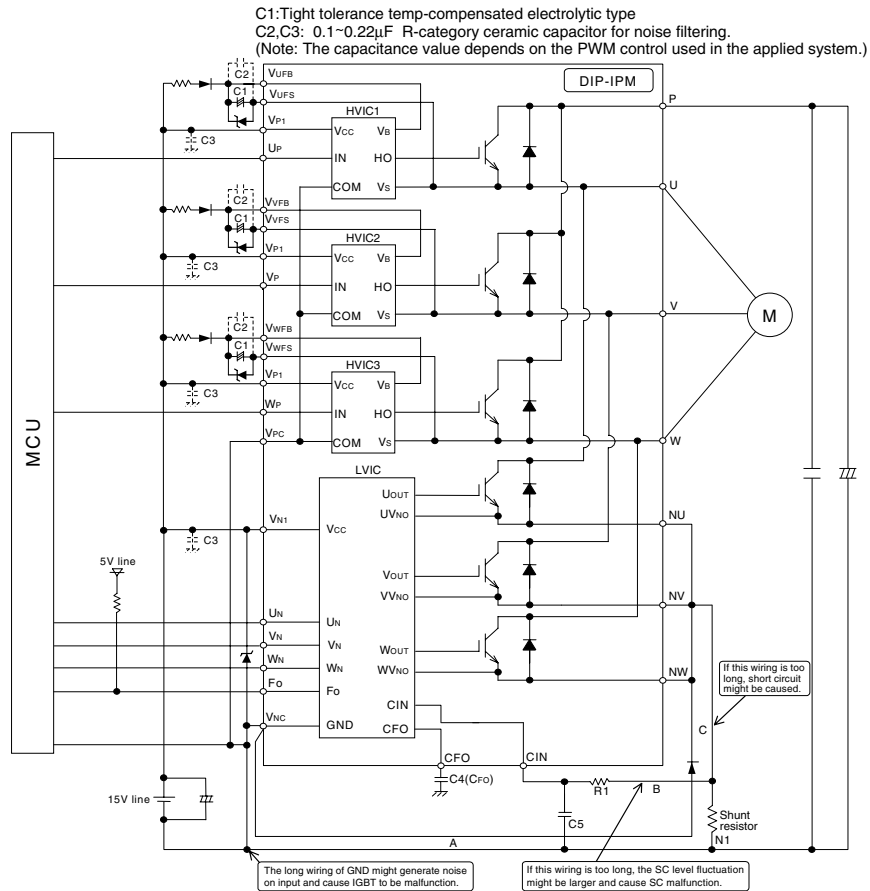

Note : RC coupling at each input (parts shown dotted) may change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board.
The DIP-IPM input signal section integrates a 2.5kΩ(min) pull-down resistor. Therefore, when using a external filtering resistor, pay attention to the turn-on threshold voltage requirement.

Fig. 7 WIRING CONNECTION WITH 1 SHUNT RESISTOR

For 3 shunt resistors connection, please refer to Fig.9.

Fig. 8 AN EXAMPLE OF TYPICAL DIP-IPM APPLICATION CIRCUIT WITH 1 SHUNT RESISTOR

- Note 1:** To avoid malfunction, the wiring of each input should be as short as possible. (less than 2-3cm)
- 2:** By virtue of integrating HVIC inside the module, direct coupling to MCU terminals without any opto-coupler or transformer isolation is possible.
- 3:** Fo output is open drain type. The signal line should be pulled up to the positive side of a 5V supply with an approximate 10k Ω resistor.
- 4:** Fo output pulse width (t_{FO}) should be determined by connecting external capacitor C4 between CFO and V_{nc} terminals. (Example : t_{FO}=2.4ms(typ.) at C_{FO}=22nF)
- 5:** Input signal is High-Active type. There is a 2.5k Ω (Min.) resistor inside IC to pull down each input signal line to GND. When employing RC coupling circuits at each input, set up RC couple such that input signal agree with turn-off/turn-on threshold voltage.
- 6:** To prevent errors of the protection function, the wiring of A, B, C should be as short as possible.
- 7:** The time constant R5C1 of the protection circuit should be selected in the range of 1.5~2 μ s. SC interrupting time might vary with the wiring pattern.
- 8:** All capacitors should be mounted as close to the terminals of the DIP-IPM as possible.
- 9:** To prevent surge destruction, the wiring between the smoothing capacitor and the P&N1 terminals should be as short as possible. Generally a 0.1~0.22 μ F snubber between the P&N1 terminals is recommended.
- 10:** It is recommended to insert a Zener diode (24V/1W) between each pair of control supply terminals to prevent surge destruction.
- 11:** To prevent LVIC from surge destruction, it is recommended to mount a fast recovery type diode between V_{nc} and NU, NV, NW terminals.
